DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 31 August 2007 has been entered.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1 and 3-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Edwards (US 5,536,267) in view of Hofling (US 5,354,279).

Edwards teaches a medical instrument comprising an elongate member (12) with a plurality of hollow needles (20, Col 6 line 27) in a bulbous ovoid configuration (Fig 6).

Regarding claims 3 and 4, the needles can be retracted into a collapsed storage configuration through the application of an external force (i.e. the walls of the elongate member) and then spring back to the bulbous ovoid shape (See Fig 7 and Fig 12-Fig 13)

Art Unit: 3767

Regarding claim 5, there is a hollow needle element (insulator sheath 28) with an aperture (filled by the needle electrode 20).

Edwards does not teach that the proximal end of the needle elements communicates with the end of the tubular member so that fluid may be delivered through the elongate tubular member into the hollow needle elements.

Hofling teaches an elongate member (12) with a lumen (Fig 1) and multiple needle elements (26) which communicate with the lumen of the elongate member (Fig 1,2). In an alternate embodiment (Fig 5) the lumens of the needles remain separate down the length of the catheter, analogous to Edwards. One of ordinary skill in the art at the time the invention was made would have expected the needles to perform equally well if the lumens are separate or combined at the distal end of the catheter.

Response to Arguments

1. Applicant's arguments are moot in view of the new grounds of rejection.
